Test validation is the procedure by which evidence is gathered to determine if test items satisfactorily represent a concept domain and whether the test measures the properties that it proposes to measure (Crocker & Algina 1986). Three types of validity were explored for the LSCI: face validity, content validity, and concurrent validity.

Development and Validation of the Light and Spectroscopy ...

Crocker, Linda; Algina, James This text was written to help the reader acquire a base of knowledge about classical psychometrics and to integrate new ideas into that framework of knowledge. The material is organized into five units: (1) introduction to measurement theory; (2) reliability; (3) validity; (4) item analysis in test development; and (5) test scoring and interpretation.

Introduction to classical and modern test theory (eBook ...

The proportion for the item is usually denoted as p and is called item difficulty (Crocker & Algina, 1986). An item answered correctly by 85% of the examinees would have an item difficulty, or p value, of .85, whereas an item answered correctly by 50% of the examinees would have a lower item difficulty, or p value, of .50.

Understanding Test Construction | SpringerLink

Crocker and Algina (1986, pp. 439-440) described the basic steps in computing percentile ranks for a raw score distribution as follows: Construct a frequency distribution for the raw scores. For a given raw score, determine the cumulative frequency for all scores lower than the score of interest.

Norm - ERIC/AE

difficulty (or p-value) for item j is defined as
$$p_j = \frac{\text{Number of examinees with a score of 1 on item } j}{\text{Number of Examinees } j}$$
