How to | Solve a Differential Equation. Replace $y[x]$ using `/.` (the short form of `ReplaceAll`) and then use `=` to define the function $f[x]$: Now, $f[x]$ evaluates like any normal function: To specify initial conditions, enclose the equation and the initial conditions (and) in a list: If not ...

It is also very useful to use Mathematica to graph slope fields, or direction fields. A slope field is a graph that shows the value of a differential equation at any point in a given range. These are very tiresome to do by hand, so learning how to do this with a computer algebra system is incredibly useful.

MATHEMATICA TUTORIAL, Part 1.2: Direction Fields

Finding symmetries for a given set of differential equations involves setting up and solving an associated system of linear homogeneous partial differential equations called determining equations. We will discuss how determining equations arise from symmet~ properties and illustrate this development by outlining the derivation of such equations for several examples.
