The distinctive forms that convection takes within Earth's mantle will be described within the context of tectonic plates and mantle plumes, whilst the implications for geochemistry and Earth's tectonic evolution will be explored.

Geodynamics texts that offer an intuitive yet richly quantitative approach to the fundamental physics, along with a broad view of a field, are disappointingly rare, but Geoff Davies' synthesis of mantle convection, *Dynamic Earth: Plates, Plumes and Mantle Convection*, is one and should be of value to many.

This could only happen, he reasoned, if relatively small, long-lasting, and exceptionally hot regions -- called hotspots-- existed below the plates that would provide localized sources of high heat energy (thermal plumes) to sustain volcanism. Specifically, Wilson hypothesized that the distinctive linear shape of the Hawaiian Island-Emperor ...

The Pacific Plate (western side of the fault) is moving horizontally in a northerly direction relative to the North American Plate (eastern side of the fault). Evidence of the sideways shift of these two landmasses can be found all along the fault zone, as seen from the differences in topography, geologic structures, and, sometimes, vegetation ...

We note that our model plumes generate Earth-like buoyancy fluxes, that our findings are consistent with other numerical studies of mantle convection with a free-slip surface (Zhong et al., 2000; Davies and Davies, 2009) and that models with imposed plate history also generate mainly vertical fully-dynamic plumes (Li and Zhong, 2019) as opposed ...

## **Plate tectonics and mantle controls on plume dynamics ...**

With plate tectonics, plumes are more mobile, and we identify four physical mechanisms controlling their stability. 1/ Fixed plumes are located at saddle points of basal mantle flow. 2/ Plumes moving at speeds between 0.5-1 cm yr<sup>-1</sup> are slowly entrained by passive mantle flow. 3/ Fast plume motions between 2-5 cm yr<sup>-1</sup> lasting several tens ...

## **This Dynamic Earth--Contents [USGS]**

Dynamic Earth presents the principles of convection in the earth's mantle in an accessible style. Mantle convection is the process underlying plate tectonics, volcanic hotspots and, hence, most geological processes. The book summarises key observations and presents the relevant physics starting from basic principles.

## **Dynamic Earth by Geoffrey F. Davies**

Although Hawaii is perhaps the best known hotspot, others are thought to exist beneath the oceans and continents. More than a hundred hotspots beneath the Earth's crust have been active during the past 10 million years. Most of these are located under plate interiors (for example, the African Plate), but some occur near diverging plate boundaries.
