The bulk of geological research in the Northern Mariana Islands has focused on the large, populous island of Saipan. The U.S. Geological Survey first mapped the island in 1956 and it was remapped again in 2007. The oldest rocks exposed at the surface are Eocene volcanic rocks, belonging to the Izu-Bonin-Mariana (IBM) arc system. Saipan is on the frontal arc of the system and experienced periodic uplift and subsidence since then.

Abstract. Tinian, which lies in the western Pacific Ocean at latitude 15°N and longitude 145°W (fig. 1), is the second largest island (39.2 mi<sup>2</sup>) in the Commonwealth of the Northern Mariana Islands (CNMI). Fresh ground water is obtained from shallow wells that tap the surface of a freshwater lens found in an aquifer composed mainly of coralline limestone.
