## **Mitosis And Meiosis Lab Answers**

Introduction: All cells come from preexisting cells and eukaryotic cells must undergo mitosis in order to form new cells. The replication of a cell is part of the overall cell cycle (Figure 1) which is composed of interphase and M phase (mitotic phase). M phase, which consists of mitosis and

Mitosis is the process of dividing body cells for growth and repair. Daughter cells are identical to the parent cell. (diploid cells)

Meiosis is the process of producing gametes (sperm and eggs). (haploid cells) The 3 mechanisms for the greatest genetic variation are: 1. Crossing over where some DNA is swapped.  
2.

What are some differences in the location and end products of mitosis and meiosis? (.5 point)

Mitosis starts with one diploid cell and ends up with two diploid cell and this occurs in all eukaryotic cells.

Meiosis starts with one diploid cell and ends up with four haploid cells and occurs in gamete or sex cells. 5.

and Meiosis ...**

Mitosis is a process of asexual reproduction in which the cell divides in two producing a replica, with an equal number of

chromosomes in each resulting diploid cell.

Meiosis is a type of cellular reproduction in which the number of chromosomes are reduced by half through the separation of homologous

CELL DIVISION:

MITOSIS AND MEIOSIS

Name: \_\_\_\_\_ Section:

\_\_\_\_\_ Objectives 1.

Identify plant and  
animal cells in each  
stage of mitosis. 2.

Model each stage of  
mitosis and meiosis. 3.

Assess the generation  
of genetic diversity due  
to the independent  
assortment of  
chromosomes.

In mitosis, the nucleus divides once, and in meiosis, the nucleus is divided twice. Mitosis produces two identical daughter cells and meiosis produces up to four different cells.

Synapsis and crossing over do not take place in mitosis, but do in meiosis. Compare mitosis and meiosis
