Question: How can you determine if a population is in Hardy-Weinberg equilibrium? Manipulate: The Hardy-Weinberg equation is $p^2 + 2pq + q^2 = 1$, where p = probability of D, q = probability of d, p^2 = probability of DD, $2pq$ = probability of Dd, and q^2 = probability of dd. Look under Show Hardy-Weinberg quantities.

(Wigginton, Cutler and Abecasis 887) This phenomenon known as “Hardy-Weinberg equilibrium” (HWE), was initially described in 1908 by an English Mathematician, Godfrey Hardy (Hardy 49) and a German physician, Wilhelm Weinberg (Weinberg 1908) who independently formulated certain assumptions, that must prevail if the genetic structure of a population is to remain the same over time and further deduced its theoretical predictions of genotype frequency (Hartl and Clark 74, Hillis et al. 298).
